Application No.: 10/071,604

Attorney Docket No. SAA-74-1 (402 P 277) Reply to Office Action of December 19, 2005

## Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

## **Listing of Claims:**

1. (Currently Amended) A method for improving communication throughout a network, the network including a module capable of transmitting messages in response to a change of state, the method comprising:

detecting an error;

calculating a raw bit error rate;

correlating a residual error probability in response to the detected error rate; and,

based on the residual error probability, retransmitting a first type of messages and shortening the length of the first type of messages, without at least one of retransmitting and shortening the length of a second type of messages.

- 2. (Previously Amended) The method of claim 1 wherein the retransmissions occur at a rate sufficient to bound the residual errors to a predetermined threshold.
- 3. (Withdrawn)
- 4. (Previously Amended) The method of claim 1 further comprising ceasing transmission of one of the first and second types of messages.
- 5. (Original) The method of claim 1 wherein correlating a residual error probability utilizes maximum-likelihood filtering.
- 6. (Original) The method of claim 5 wherein the maximum-likelihood filtering utilizes Kalman filtering.
- 7. (Previously Amended) The method of claim 1 wherein correlating a residual error probability utilizes rate of deterioration.

Application No.: 10/071,604

Attorney Docket No. SAA-74-1 (402 P 277) Reply to Office Action of December 19, 2005

- 8. (Previously Amended) The method of claim 1 wherein detecting the error utilizes a packet identifier.
- 9. 16. (Withdrawn)
- 17. (Currently Amended) An apparatus for reducing the effect of undetected communication errors transmitted throughout a network, the network having a module and being configured such that messages are transmitted from the module in response to a change of state of the module, the apparatus comprising:

means for determining an undetected bit error probability; and,

means for improving accurate message transmission being responsive to the means for determining an undetected bit error probability wherein undetected bit errors transmitted throughout the network are bound to a predetermined threshold, and wherein the means for improving accurate message transmission comprises means for retransmitting a first type of messages and shortening the length of the first type of messages, without at least one of retransmitting and shortening the length of a second type of messages.

- 18. (Original) The apparatus of claim 17 further comprising means for determining a detected bit error rate.
- 19. (Original) The apparatus of claim 18 wherein the means for determining a detected bit error rate comprises: a bit error monitor for detecting bit errors; a counter being operably responsive to the monitor, the counter being capable of tallying an amount of detected bit errors; and, a calculator being operably connected to the counter, the calculator being capable of determining a detected bit error rate in response to the amount of detected bit errors.
- 20. (Original) The apparatus of claim 19 wherein the means for determining an undetected bit error probability comprises: an extrapolator for correlating an undetected bit error probability in response to the determined detected bit error rate.

Application No.: 10/071,604

Attorney Docket No. SAA-74-1 (402 P 277) Reply to Office Action of December 19, 2005

21. (Original) The apparatus of claim 17 further comprising: a corrective action flag, the corrective action flag being set in response to the undetected bit error probability exceeding a predetermined threshold.

22. (Original) The apparatus of claim 17 wherein the means for improving accurate message transmission comprises: a message repeater for repetitively transmitting messages throughout the network in response to a change of state and at a rate sufficient to bound the undetected errors to a predetermined threshold.

23. (Canceled)

24. (Original) The apparatus of claim 17 wherein the means for improving accurate message transmission comprises: a message transmission terminator for ceasing transmission of network messages.

25. (Original) The apparatus of claim 17 further comprising: a maximum-likelihood filter being operably connected to the extrapolator.

26. (Original) The apparatus of claim 25 wherein the maximum-likelihood filter is a Kalman filter.

27. (Original) The apparatus of claim 17 further comprising: a differentiator being operably connected to the extrapolator for determining the first derivative of the calculated detected bit error rate.

28. (Original) The apparatus of claim 17 further comprising: a packet identifier, the packet identifier being a portion of the message and being utilized by the bit error detector for detecting a message having an error.

29. – 44 (Withdrawn)
